Objects

Objects are the basic unit for data storage in OSS. Objects are also known as files. OSS stores all files as objects in buckets, and does not use a hierarchical structure to store objects.

⚠ Cost and performance optimization suggestions: Your version control is in the Open state. The space occupied by historical versions will increase your cost. If you delete too many tags, the return delay of the current version object in the List will increase. Be sure to configure a lifecycle policy to help you automatically clean up historical versions and delete markers. One-Click Configuration
